范文网，为你加油喝彩！

应用场景：

有这么一个返现的系统，当前端客户发起提现的时候，后端就要通过审核这笔返现订单，才可以返现到客户的账号里。

来看看下面的截图

这里的业务场景就是经过两轮审核：销售审核，财务审核都通过后，后端就会付款一笔钱到客户，当然，这里财务审核会有很多种情况，不通过与通过，通过后直接付款又有很多种情况，详细可以查看微信支付到零钱的文档。下面就来看看具体你的代码实现

微信支付配置

1，数据表大概如下

```
create table `zmq_weixin_config` ( `id` int(1) unsigned not null auto_increment comment '微信公众平台编号，自增id', `weixin_name` varchar(10) not null comment '微信公众平台名称', `token` varchar(100) not null, `appid` char(18) not null, `appsecret` char(32) not null, `access_token` varchar(300) not null, `api_ticket` varchar(300) default null comment '微信卡包api_ticket', `api_ticket_expired_at` datetime default null comment '微信卡包api_ticket过期时间', `mchid` varchar(20) default null comment '商户号', `mchkey` varchar(50) default null comment '支付密钥', `expired_at` timestamp null default null comment 'access_token过期时间，会自动更新', `updated_at` timestamp null default null comment '记录更新时间', `created_at` timestamp null default null comment '创建时间', `sort_order` smallint(5) not null default '0' comment '排序', `points_url` varchar(100) default null, primary key (`id`)) engine=mysam auto_increment=11 default charset=utf8 checksum=1 delay_key_write=1 row_format=dynamic comment='微信配置表';
```

2.config的配置方法

```
/** * 获取微信支付配置 * 这里我是把配置信息存储在数据表里，方便调用 * $param是从controller里传值过来：weixin_config_id，notify_url * @return array */ public function getwechatconfig($param){ $weixin = weixinconfigbasemodel::find($param['weixin_config_id']); if (empty($weixin)) { throw new exception('微信配置id错误'); } return [
```

```
'wechat'=>[ $app_id=>$weixin->appid, 'mch_id'=>$weixin->mchid, 'notify_url'=>empty($param['notify_url'])?'':$param['notify_url'],//回调url 'key'=>$weixin->mchkey, 'cert_client'=>resource_path().'/wechat/'.$weixin->id.'/apiclient_cert.pem',//证书与key 'cert_key'=>resource_path().'/wechat/'.$weixin->id.'/apiclient_key.pem', ]];}
```

企业付款到个查无音信怎么读人零钱核心代码

```
/** * 获取微信支付配置 * 这里我是把配置信息存储在数据表里，方便调用 学期计划 * $param是从controller里传值过来：weixin_config_id, notify_url * @return array */public function getwechatconfig($param){ $weixin = weixinconfigbasemodel::find($param['weixin_config_id']); if (empty($weixin)) { throw new exception('微信配置id错误'); } return [ 'wechat'=>[ $app_id=>$weixin->appid, 'mch_id'=>$weixin->mchid, 'notify_url'=>empty($param['notify_url'])?'':$param['notify_url'],//回调url 'key'=>$weixin->mchkey, 'cert_client'=>resource_path().'/wechat/'.$weixin->id.'/apiclient_cert.pem',//证书与key 'cert_key'=>resource_path().'/wechat/'.$weixin->id.'/apiclient_key.pem', ]];}
```

财务审核，也就是微信返现到零钱，这个时候会返回成功结果，或者是各种不成功的结果

这里我用一个方法封装

```
//财务审核if($param['status']==2){ //判断返现金额与修改后的金额 if($before_rebate_amount != $param['rebate_amount']){ //返现金额不相等，则出款金额改变 $out_amount = $param['rebate_amount'] - $before_rebate_amount; $this->outmount($business->business_id,$out_amount); } if($param['rebate_status']==9){ //财务拒绝通过 $business->audit_status = $param['rebate_status']; $business->rebate_amount = $param['rebate_amount']; $business->status = 6; $business->save(); //生成日志 $this->insertwithdrawlog($param['withdraw_id'],$business->status,$business->audit_status,$param['rebate_remark'],$param['admin_id']); }else{ //提现的各种返回结果 $this->payreturnresult($business,$param); }}
```

```
/** * function:微信提现返回的各种结果 * author:cyw0413 * @param $res * @param $business * @param $param */public function payreturnresult($business,$param){ $input = [ 'weixin_config_id'=>20, 'openid' =>$business->business->open_id, 'amount' =>$param['rebate_amount'] * 100, 'trade_no' =>$business->order_sn, //商户订单号 'desc' =>"微信提现" ]; $pay = new paylogbaseservice(); $res = $pay->weixinpay($input); if($res['result_code']=="success"){ //提现成功 $business->audit_status = 4; $business->status = 4; $business->rebate_amount = $param['rebate_amount']; $param['rebate_remark'] = "已付款(".$param['rebate_amount'].")";上海场地出租 }elseif ($res['err_code']=="money_limit"){ $business->audit_status = 3; $business->status = 3; $param['rebate_remark'] = "提现失败，已达到付款给此用户额度上限"; //throw new \exception($param['rebate_remark']); }elseif ($res['err_code']=="amount_limit"){ $business->audit_status = 3; $business->status = 3; $param['rebate_remark'] = "提现失败，低于最低付款金额或者高于最高付款金额"; //throw new
```

```
\exception($param['rebate_remark']);egdf }elseif ($res['err_code'] == "notenough"){  
$business->audit_status = 3; $business->status = 3; $param['rebate_remark']  
= "提现失败，付款帐号余额不足或资金未到账"; //throw new \exception($param['re  
bate_remark']); }elseif ($res['err_code'] == "sign_error"){ $business->audit_status =  
3; $business->status = 3; $param['rebate_remark'] = "提现失败，签名错误"  
; }elseif ($res['err_code'] == "param_error"){ $business->audit_status = 3; $business->  
status = 3; $param['rebate_remark'] = "提现失败，参数错误"; }elseif ($res['err_code'] == "openid_error"){ $business->audit_status = 3;  
$business->status = 3; $param['rebate_remark'] = "提现失败，openid错误"; }elseif ($res['err_code'] == "fatal_error"){ $business->audit_status = 3; $business->  
status = 3; $param['rebate_remark'] = "提现失败，两次请求参数不一致"; }elseif ($res['err_code'] == "ca_error"){ $business->audit_status = 3; $business->  
status = 3; $param['rebate_remark'] = "提现失败，商户api证书校验出错"; }elseif ($res['err_code'] == "v2_account_simple_ban"){ $business->audit_status = 3; $business->  
status = 3; $param['rebate_remark'] = "提现失败，无法给非实名用户付款";  
}else{ $business->audit_status = 3; $business->status = 3; $param  
['rebate_remark'] = "提现失败，服务器繁忙，请稍后再试"; //throw new \exception($  
param['rebate_remark']); } $business->save();}
```

当微信平台余额不足或者出现各种错误而提现失败的时候，这里还有支持重新付款的功能：其实就是点击按钮后重新调用付款到零钱的功能，知道成功付款

```
/** * function:重新付款 * author:cyw0413 * @param $param * @throws \exception *  
/public function repay($param){ if(empty($param)){ throw new \exception("参数错误"); } $business = groupbusinesswithdrawbasemodel::find($param['withdraw_id']); if(empty($business)){ throw new \exception("不存在！"); } if($business->audit_status != 3){ throw new \exception("状态有错误"); } //提现的各种返回结果 $this->payreturnresult($business,$param);}
```

总结

以上所述是www.887551.com给大家介绍的php实现财务审核通过后返现金额到客户的功能,希望对大家有所帮助
